

Product Requirements Document

Online Gaming Website (Rockstar Games Clone)

Reference Website: <https://www.rockstargames.com>

Category: Web Development

Date: June 2026

Prepared By: Abu Bakar

This Product Requirements Document (PRD) outlines the purpose, target audience, core features, functional workflows, non-functional standards, screen blueprints, and technical boundaries for the Online Gaming Website. It serves as the business-focused master blueprint for stakeholders and developer alignment.

1. Project Overview

1.1 Problem Statement

Modern gaming studios require highly immersive, performant, and secure web hubs to engage communities, showcase game media, coordinate player statistics, and distribute merchandise. Static, generic sites fail to capture the premium AAA experience. This project bridges this gap by creating an interactive, dark-themed clone of rockstargames.com that satisfies the expectations of digital-native gamers.

1.2 Product Vision

To establish a state-of-the-art web portal that seamlessly integrates marketing (trailers, key art), content publishing (Newswire updates), commerce (games/apparel store), community engagement (profile progression), and user assistance (support portal) under a cohesive, high-contrast visual brand identity.

1.3 Target Users

- **Core Gamers:** Fans of AAA action-adventure, open-world, and online multiplayer games seeking updates.
- **Online Consumers:** Registered players looking to purchase game keys, launcher items, or physical merchandise.
- **Community Members:** Players tracking their in-game achievements, crew memberships, and social statistics.
- **Support Seekers:** Users troubleshooting technical or account issues through guides or customer service tickets.

2. Key Features

Feature Module	Description
Homepage & Carousel	Interactive header, global search, and auto-rotating hero slides with trailers.
Games Library	Grid of game titles with platform badges, filters (platform, franchise), and sorting.
Game Detail Pages	Rich descriptions, screenshot lightbox galleries, and minimum/recommended PC specs.
Newswire (Blog)	Filterable content feed with categorized articles (updates, events, patch notes).
Videos Page	Grid of official game trailers and gameplay previews with inline modal video player.
Store / E-Commerce	Product pages, shopping cart manager, and checkout flow with payment placeholders.
User Account System	JWT login/register, customizable profiles, game statistics, and achievements.
Support Desk & Status	Knowledge base, support tickets with files, and live game server health indicator.

3. User Flow

The portal accommodates three primary user journeys:

- **Discovery Journey:** User enters Homepage -> opens global search or navigates to Games Library -> reads a Newswire article or watches a video trailer -> clicks Buy Now to redirect to Store.
- **Account & Progression Journey:** User registers -> verifies email -> logs in -> accesses Account Dashboard -> uploads avatar -> links games -> reviews unlocked achievements and play stats.
- **Support Ticket Journey:** User visits Support Home -> searches articles -> views Server Status -> clicks 'Submit a Ticket' -> uploads error screenshots -> receives confirmation.

4. Functional Requirements

The system must implement the following business behaviors:

- **Authentication:** Users must be able to sign up, verify emails, log in securely, and request password resets.
- **Media Interaction:** Hero carousel must rotate every 5 seconds; videos must open in overlay modals without leaving the page.
- **E-Commerce Cart:** Users must be able to add/remove products, adjust quantities, persist cart state across sessions, and complete a sandbox checkout form.
- **Global Search:** The search bar must return categorised results (Games, News, Videos, Support) with auto-complete.
- **Support System:** Tickets must validate attachments (PNG/JPG < 5MB) and display live server status (Operational/Degraded/Down) for multiplayer games.

5. Non-Functional Requirements

5.1 Performance & SEO

The website must target a Lighthouse performance score of 90+ on desktop. All images must be lazy-loaded and delivered in WebP format. Dynamic meta tags (Open Graph, Twitter Cards) and structured schema.json-ld metadata must be generated for all public pages to optimize search engine ranking.

5.2 Usability & Responsiveness

The layout must be responsive, optimizing for desktop (1920px), tablet (768px), and mobile (375px) viewports. Touch targets must be at least 44x44px. Color contrast must respect WCAG 2.1 AA guidelines (minimum 4.5:1 ratio for text). Keyboard navigation and ARIA tags are mandatory on all interactive overlays, modals, and dropdown forms.

5.3 Security

All credentials must be stored securely. User sessions must be managed with JWT tokens stored in secure, HTTP-only cookies. Client-side states (e.g., active cart items) must be stored in encrypted localStorage or session state.

6. Screens / Modules

Screen / Module	Core Components
Homepage	Hero video slides, latest news cards, newsletter subscription footer.
Games Directory	Franchise filter chips, platform badges, grid layout of all titles.
Game Details	Hero image banner, screenshot gallery lightbox, PC spec tables.
Newswire	Paginated article feed, category filters, rich text body reader.
Video Hub	Interactive player modal, category tabs, video duration metadata.
Store Catalog	Product sorting, category menus, sale badges, add-to-cart controls.
User Profile Settings	Avatar upload, username edit fields, achievement list, linked games.
Support Hub	FAQ accordions, search bar, ticket form, live server status checks.

7. Deliverables Summary

The development team will deliver the following assets:

- **Public Web Codebase:** A repository containing Next.js source code, components, and configuration files.
- **Database Scripts:** MongoDB seed scripts for games, store items, newswire articles, and FAQs.
- **Design Artifacts:** Brand logos (SVG), optimized WebP thumbnails, and high-fidelity mockups.
- **Technical Docs:** A developer instruction.md, scope boundaries, evaluation rubrics, and the PRD PDF.

8. Technical Notes

8.1 Architectural Constraints

- **Framework:** Next.js 14+ utilizing App Router for optimized Server-Side Rendering (SSR) and static generation.
- **Database & State:** MongoDB for flexible JSON storage. Client-side React context for cart/search state.
- **Integrations:** NextAuth.js for session management. Stripe API placeholder keys for payment flows.

8.2 System Boundaries & Out of Scope

This platform is a web interface; playable games in-browser, real financial checkout transactions, native mobile applications, active multiplayer game servers, and console-account synchronization (PSN/Xbox Live) are strictly out of scope for this phase.

PRD Status: Approved
